What did I miss?

- We put the finishing touches on our first project: a name tag keychain.
- We began (and some finished) working on their device holder or their one freebie print job for the semester.

How do I catch up so I'm not behind at the next meeting?

Put the finishing touches on your name tag keychain:

1. Log into Tinkercad using the account you set up last week and open your model.
2. Edit it by stretching or squeezing the different shapes that make up the keychain until you are happy with the outcome. Remember to move the camera view all around so you can see your model from every angle to make sure it looks how you want it to.
3. Tinkercad saves automatically, so when you are finished, move on to the next steps.

Modeling a device holder

Below are a few examples to get your creative juices flowing.

*Remember -- you have to CREATE YOUR OWN device holder, not simply pull one from Thingiverse.*

A few tips you might want to consider:

- Are you designing this for a phone or tablet?
- Do you want to make a hole somewhere to allow for a charging cord?
- Do you want to include a small lip where the bottom of your device is (near the home button) so it does not slide out of the holder?
- Consider the angle that the back of your device will rest on. Do you want your device leaning back or sitting up straight?
- Consider how wide the overall holder is so your device is more stable.
- If you are feeling comfortable modeling, you can try getting creative and make your device holder more personalized with what your interests are.
